BDB Pitmans

Solid and glazed movable walls transform private meeting rooms into one open, multifunctional suite, giving BDB Pitmans the flexibility to make more of its space.

Location: London

Systems: Type 100SE, Type G100

Client: Fabric Interior Design + Architecture

BDB Pitmans wanted a workspace that could adapt to different demands: enclosed rooms for everyday use, with the freedom to open them into one large multifunctional suite.

Movawall delivered a movable wall solution combining solid and glazed panels, bringing flexibility into the fabric of the interior. The brief called for more than a conventional room divider. The walls needed to work together as a complete system, allowing the layout to change while supporting the architectural character of the space.

Combining our Type 100SE solid movable walls with our Type G100 glazed acoustic system provided that versatility. Crittall-effect detailing gives the glazing a distinctive appearance, while the combination of solid and transparent surfaces balances enclosure with an open, light-filled feel. The G100 system brings glazing and acoustic performance together, helping separate spaces without losing their visual connection.

Designed with architects Fabric Design, the installation comprises 54 panels with a combined weight of approximately six to seven tonnes. Together, they create a substantial yet adaptable arrangement that allows individual rooms to become part of a much larger space.

The result is a suite that can change with the occasion. Closed, the walls define separate rooms. Open, they bring the space together for larger gatherings and shared activities, giving BDB Pitmans greater choice in how it uses the same floor area.
